

AT08401: Getting Started with Atmel ATmega328PB

APPLICATION NOTE

Description

This application note aims at getting started with the Atmel® ATmega328PB AVR® based microcontroller.

Features

- Getting started with the ATmega328PB microcontroller and tools
- Getting started with Atmel ATmega328PB Xplained Mini Kit and Atmel Studio 6.2

This application note contains a list of all necessary tools required to start the work and points to where to look for additional information.

1. Getting Started with Atmel ATmega328PB

1.1. Key Features

- AVR (Harvard) architecture
- Single level pipelining
- In-system reprogrammable flash memory
- Separate EEPROM section available
- Optional boot code section with independent lock bits
- 20MIPS @ 20MHz
- Most single clock cycle execution
- Low power microcontroller with various sleep modes
- High code density (advanced RISC Instruction Set)
- On-chip hardware multiplier
- Short interrupt latency four clock cycles
- Factory calibrated internal RC oscillator
- Security with fuses and lock bits
- Atmel QTouch[®] Library support
- Compatibility between devices (portability)
- Peripheral touch controller
- Clock Failure Detection (CFD)

Note: For detailed information (like AVR architecture, flash size, number of pins, operating voltage range, number of peripheral channels, module description, etc.) refer to the ATmega328PB datasheet.

1.2. Device Related Website Links

The ATmega328PB product overview webpage (as shown in the figure below) is available at:

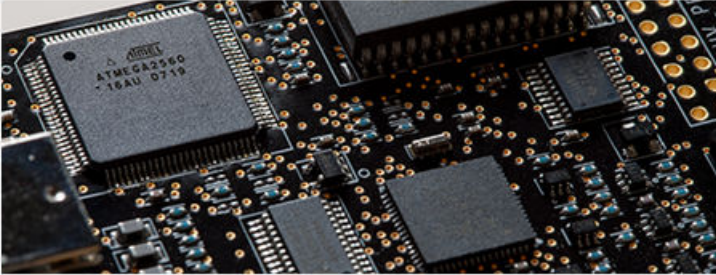

<http://www.atmel.com/devices/ATMEGA328PB.aspx>

The high-performance Atmel® ATmega328PB is an 8-bit AVR RISC-based microcontroller (MCU) with picoPower® technology. It combines 32kB ISP Flash memory with read-while-write capabilities, 1kB EEPROM, 2kB SRAM, 27 general purpose I/O lines, 32 general purpose working registers, five flexible timer/counters with compare modes, internal and external interrupts, two USARTs with wake-up on start of transmission, two byte-oriented 2-wire serial interfaces, two SPI serial ports, 8-channel 10-bit A/D converter, programmable watchdog timer with internal oscillator, a unique serial number and six software selectable power saving modes. The device operates between 1.8-5.5 volts.

The ATmega328PB is the first 8-bit AVR MCU to feature the QTouch® Peripheral Touch Controller (PTC), which acquires signals in order to detect touch on capacitive sensors, and supports both self- and mutual-capacitance sensors. The PTC is supported by the QTouch Composer development tool (QTouch Library project builder and QTouch Analyzer). It provides a faster and less complex capacitive touch implementation in any application.

The ATmega328PB supports 24 buttons in self-capacitance mode, or up to 144 buttons in mutual-capacitance mode. Mixing and matching mutual- and self-capacitance sensors is possible, and only one pin is required per electrode – no external components are required, delivering savings on the BOM cost compared to competing solutions.

By executing powerful instructions in a single clock cycle, the device achieves throughputs approaching 1 MIPS per MHz, balancing power consumption and processing speed.

Key Parameters

Parameter	Value
Flash (Kbytes):	32 Kbytes
Pin Count:	32
Max. Operating Freq. (MHz):	20 MHz
CPU:	8-bit AVR
# of Touch Channels:	12
Hardware QTouch Acquisition:	Yes
Max I/O Pins:	27
Ext Interrupts:	27
USB Speed:	No

In the **Parameters** tab, the configuration parameter details (like flash size, number of peripheral channels, number of I/O pins, etc.) for this device can be found.

<http://www.atmel.com/devices/ATMEGA328PB.aspx?tab=parameters>

In the **Documents** tab, all the related documents (like datasheet and application notes) for this device can be found.

<http://www.atmel.com/devices/ATMEGA328PB.aspx?tab=documents>

In the Datasheet section under the **Documents** tab today there are two documents:

1. Preliminary / Complete version (includes all peripheral descriptions and electrical characteristics).
2. Preliminary Summary / Summary version (includes Ordering Information, pin out, and Packaging Information).

The device related application notes (like e.g. hardware design considerations) and its associated firmware (if any) are also available under the **Documents** tab.

In the **Applications** tab, the recommended application areas (not limited to) for this device can be found.

<http://www.atmel.com/devices/ATMEGA328PB.aspx?tab=applications>

In the **Tools** tab, all the related tools (like IDE, programmer, debugger, evaluation kits, BSDL files) for this device can be found.

<http://www.atmel.com/devices/ATMEGA328PB.aspx?tab=tools>

The ATmega328PB Xplained Mini kit's webpage can be viewed by clicking the ATmega328PB Xplained Mini available in the following link:

<http://www.atmel.com/devices/ATMEGA328PB.aspx?tab=tools>

1.3. **ATmega328PB Xplained Mini Kit**

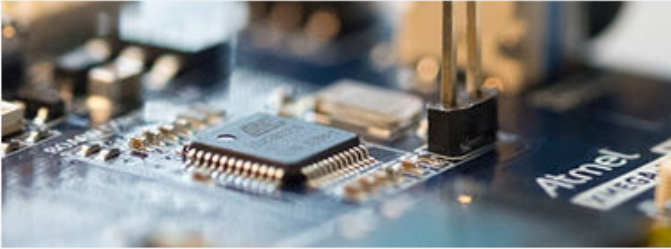

The kit can be ordered online by clicking **Add to Cart** in the following link:

The Atmel® ATmega328PB Xplained Mini evaluation kit is a hardware platform for evaluating the Atmel ATmega328P microcontroller (MCU). The evaluation kit comes with a fully integrated debugger that provides seamless integration with Atmel Studio 6.2 or later. The kit provides access to the features of the ATmega328PB MCU enabling easy integration of the device into a custom design.

It features four capacitive buttons for easy evaluation of the integrated Atmel QTouch® Peripheral Touch Controller (PTC).

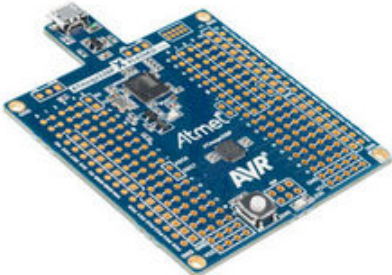

Key Features

- On-board debugger with full source-level debugging support in Atmel Studio.
- Auto-ID for board identification in Atmel Studio 6.2
- Access to all signals on target MCU
- One green status LED
- One mechanical user push button
- Four capacitive touch buttons (underneath the AVR logo)
- Virtual COM port (CDC)
- 16MHz target clk
- USB powered
- Arduino shield compatible foot prints
- Target SPI bus header foot print
- Xplained Pro extension headers can easily be strapped in
- Supported with application examples published on Atmel Spaces

Ordering Information

In the **Documents** tab, all the kit related documents like schematics and user guide can be found.

<http://www.atmel.com/tools/MEGA328PB-XMINI.aspx?tab=documents>

Note: For detailed information like header and connections, refer to the ATmega328PB Xplained Mini User Guide, which is available at the under the **Documents** tab.

1.4. Atmel Studio

1.4.1. Atmel Studio Webpage

The Atmel Studio installer (free IDE) is available at:

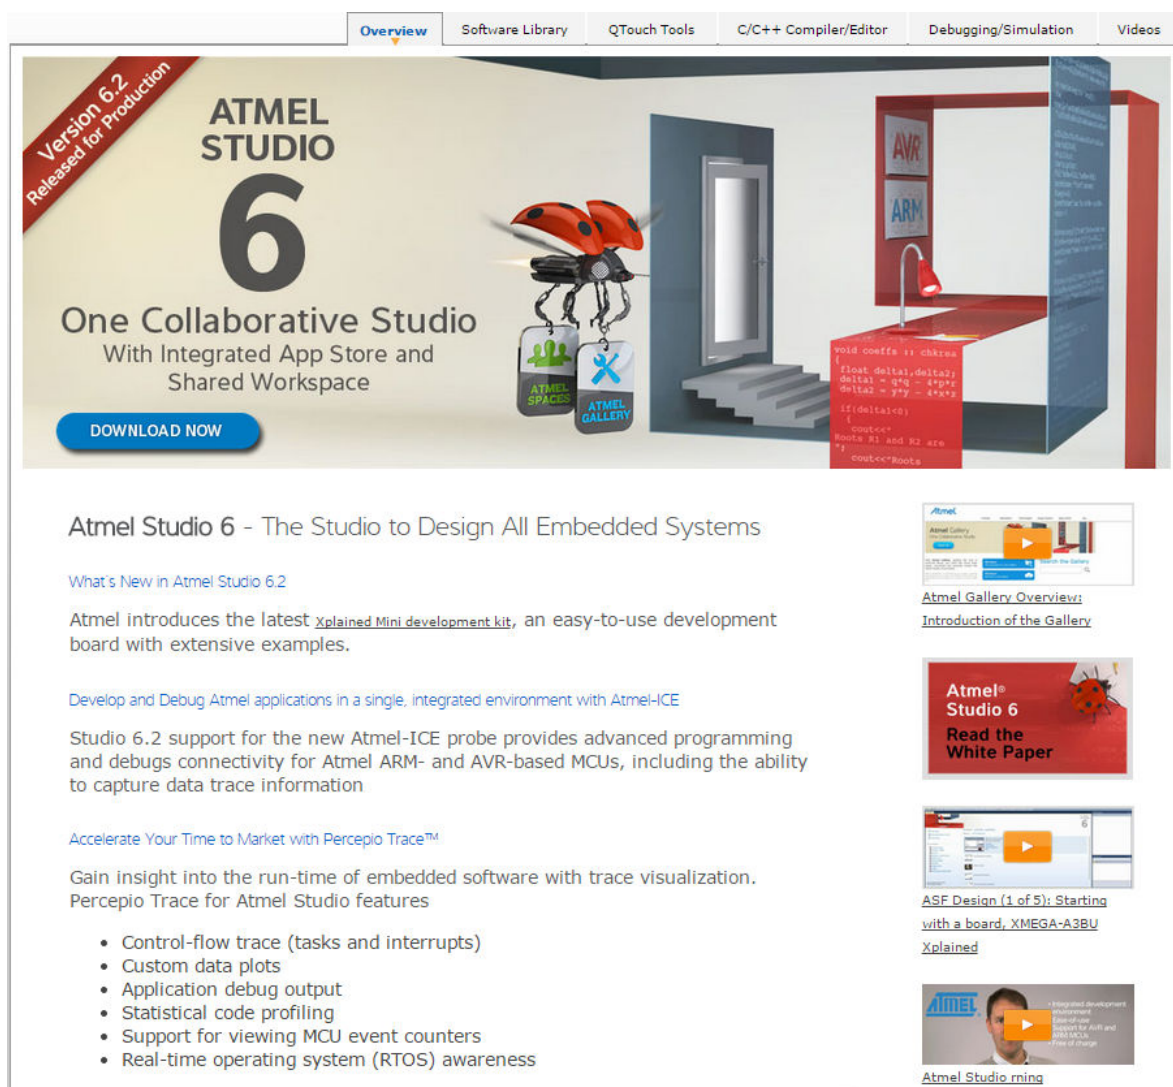

<http://www.atmel.com/tools/ATMELSTUDIO.aspx>

1.4.2. Atmel Studio Microsite

To learn more about Atmel Studio, refer to the following microsite:

http://www.atmel.com/microsite/atmel_studio6/

Figure 1-3 Atmel Studio Microsite Webpage

In the **Videos** tab the getting started videos (like editor, creating a new C (GCC) project, debugging AVR applications, debugging ARM® applications, etc.) can be found.

http://www.atmel.com/microsite/atmel_studio6/videos.aspx

1.5. Connecting the ATmega328PB Xplained Mini kit

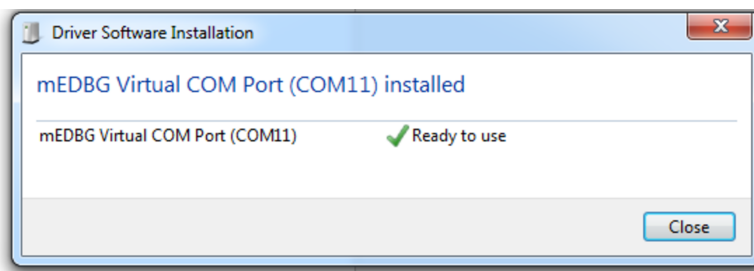

This section helps the user to connect the ATmega328PB Xplained Mini with the Atmel Studio 6.2 SP2 (6.2.1563).

1. Download and install [Atmel Studio](#) version 6.2 SP2 (6.2.1563) or later versions.
2. ATmega328PB Part Pack for Atmel Studio 6.2 available in the [Atmel Studio](#) link has to be installed. This bundle adds support for ATmega328PB device in Atmel Studio 6.2.SP2.
Note: There is no need to install part pack for Atmel Studio future versions.
3. Launch the Atmel Studio.
4. Connect the ATmega328PB Xplained Mini to the USB port and it will be visible in the Atmel Studio.

1.5.1. Auto Board Identification of Xplained Mini Kit

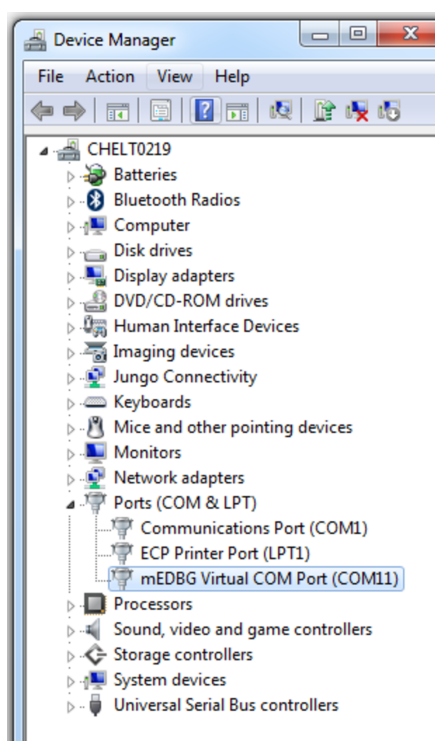

- Once the ATmega328PB Xplained Mini kit is connected to the PC, the Windows® Task bar will pop-up a message as shown in [Figure 1-4 ATmega328PB Xplained Mini Driver Installation](#) on page 8.

Figure 1-4 ATmega328PB Xplained Mini Driver Installation

- If the driver installation is proper, EDBG will be listed in the Device Manager as shown in [Figure 1-5 Successful mEDBG Driver Installation](#) on page 9

Figure 1-5 Successful mEDBG Driver Installation

- Open Atmel Studio 6.2, go to **View** → **Available Atmel Tools**. The EDBG should get listed in the tools as mEDBG and the tool status should display as "Connected". This indicates that the tool is communicating properly with the Atmel Studio.

Figure 1-6 mEDBG under Available Atmel Tools

1.5.2. Connect the ATmega328PB Xplained Mini UART to the mEDBG COM Port

1. Connect the mEDBG USB to the PC.
2. Use the Device Manager to find the COM port number.
3. Default COM port settings are 9600 baud N 8 1. The COM port settings can be changed by using the Device Manager.

1.6. Programming and Debugging

This section helps to program and debug the ATmega328PBXplained Mini kit by using mEDBG.

1.6.1. Programming the ATmega328PB Xplained Mini by using mEDBG

1. Connect the mEDBG USB to the PC.
2. Go to the Atmel Studio: Click **Tools**, select **Device Programming**, and then select the connected mEDBG as **Tool with Device** as ATmega328PB and **Interface** as ISP, click **Apply**.
3. Select **Memories** and locate the source .hex or .elf file and then click **Program**.

4. If the source contains fuse settings, go to **Production file** and upload the .elf file and program the fuses.

Note: If ISP programming fails it could be because the debugWIRE is enabled. See [debugging section](#) on how to disable debugWIRE mode.

1.6.2. Debugging the ATmega328PB Xplained Mini by using mEDBG

1. Start **Atmel Studio**.
2. Connect the mEDBG USB to the PC.
3. Open your project.
4. In the **Project** menu select the project properties page. Select the **Tools** tab and select mEDBG as debugger and debugWIRE as interface.
5. In the **Debug** menu click **Start Debugging and Break**.
6. Atmel Studio will display an error message if the DWEN fuse in the ATmega328PB is not enabled, click YES to make Studio set the fuse using the ISP interface.
7. A debug session is started with a break in main. Debugging can start.
8. When exiting debug mode select **Disable debugWIRE and Close** in the **Debug** menu, this will disable the DWEN fuse.

Note: If the debug mode is not exited by selecting **Disable debugWIRE and Close** in the **Debug** menu, the DWEN fuse will be enabled and the target will still be in debug mode, i.e. it will not be possible to program the target by using the SPI (ISP) interface.

2. Creating an Example Application in Atmel Studio

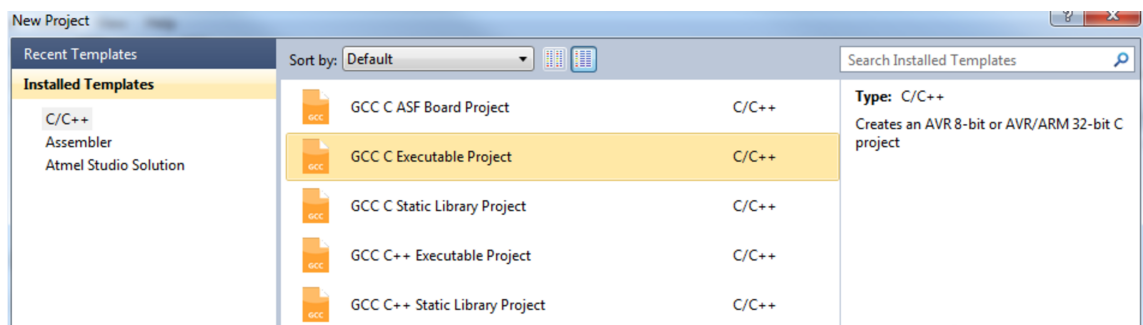

1. After connecting the board, to create a new project in Atmel Studio go to **File** → **New** and click on **Project** (as shown in [Figure 2-1 Creating New Project in Atmel Studio](#) on page 11).

Figure 2-1 Creating New Project in Atmel Studio

2. The New Project wizard will display as shown in [Figure 2-2 New Project Wizard](#) on page 11. Select the **GCC C executable Project** template, name the project and click **OK** to get the device selection wizard.

Figure 2-2 New Project Wizard

3. The Device Selection wizard will display as shown in [Figure 2-3 Device Selection Wizard](#) on page 11. Select the ATmega328PB device from megaAVR® device family and click **OK**.

Figure 2-3 Device Selection Wizard

4. The new project and the .c file will be created as shown in [Figure 2-4 Project Window](#) on page 12.

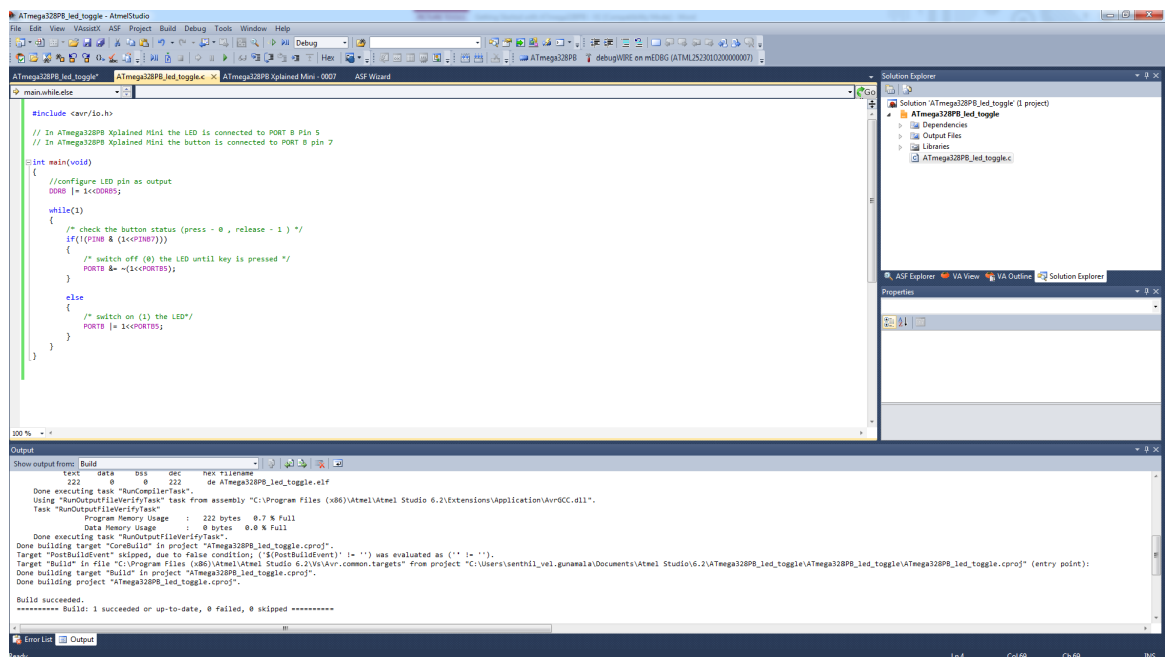

Add the following code snippet (LED control using push button) in the .c file.

```
int main(void) {
    /* configure LED pin as output */
    DDRB |= 1<<DDRB5;
    while(1) {
        /* check the button status (press - 0 , release - 1 ) */
        if(!(PINB & (1<<PINB7))) {
            /*switch off (0) the LED until key is pressed */
            PORTB &= ~(1<<PORTB5);
        } else {
            /* switch on (1) the LED*/
            PORTB |= 1<<PORTB5;
        }
    }
}
```

5. Code explanation:

- Each PORT has three registers DDRx, PORTx, and PINx
- The DDRx register is used to configure the port pin direction. 1 - Output; 0 - Input.
- If one pin is configured as output pin and if the respective bit in PORTx is written logic one, the respective port pin is driven high. If the same bit is written logic zero, the pin will be driven low.
- The PINx register is used to return the logic level available on the port pin
- In this example code the PB7 Button is used as input and the PB5 LED0 as output
- Here the LED0 is controlled based on the pushbutton status
- As long the button is in pressed state (0) the LED0 will not glow (0)
- On releasing the button (1) the LED0 will glow (1 - default)

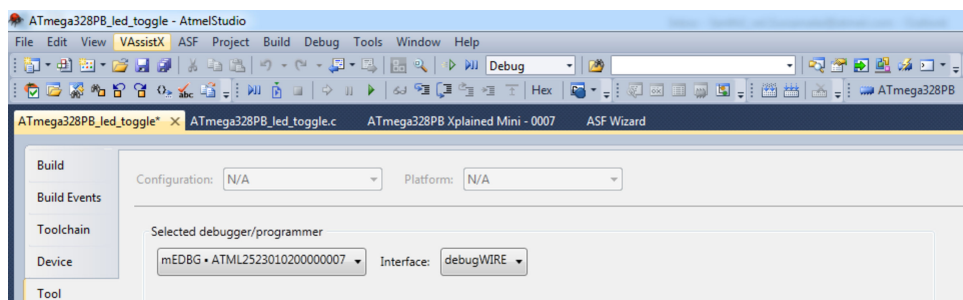

Figure 2-4 Project Window

6. In order to debug this project, configure the Tool and Interface in the Project properties. To open the project properties, go to **Project** menu → **Properties**. In the project properties, go to **Tool** tab → Under the **Selected Debugger/Programmer**, select the tool as mEDBG and interface as

debugWIRE as shown in [Figure 2-5 Tool and Interface Settings](#) on page 13 Tool and Interface Settings.

Figure 2-5 Tool and Interface Settings

7. To program and execute the application, there are two options:
 - Start a debug session on the board, where the user will be able to program and debug
 - Program the generated .hex file into the controller and execute the application

Both these options can be configured on ATmega328PB Xplained Mini as shown in [Figure 2-6 Start without Debugging](#) on page 13 and [Figure 2-7 Start Debugging and Break](#) on page 13.

Figure 2-6 Start without Debugging

Figure 2-7 Start Debugging and Break

Note: If the debug mode is not exited by selecting **Disable debugWIRE and Close** in the **Debug** menu, the DWEN fuse will be enabled and the target will still be in debug mode, i.e. it will not be possible to program the target by using the SPI .
